

## **Telephone Directory Management System**

The system allows users to:

1. **Add a Contact** – Store a person's name and phone number.
2. **Search for a Contact** – Retrieve a stored contact and update the number if needed.
3. **Delete a Contact** – Remove a contact from the directory.
4. **Display All Contacts** – View the complete list of saved contacts.
5. **Exit**

The program runs in a loop, allowing users to perform multiple actions until they choose to exit. This is a basic implementation using a dictionary in Python to store contact details.
